No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DB

```

000 00000 000

Expression vectors for transforming insect cells from disparate lines useful to express heterologous DNA, e.g. to allow study of gene expression and produce commercially important proteins.

WPI; 1998-557129/47. Grigliatti TA, 27-MAR-1997; 28-JAN-1998; 26-MAR-1998;

The CC invention provides a new shuttle vector for transforming insect cells CC that comprises: (i) prokaryotic origin of replication; (ii) insect CC promoter having homology to, and capable of functioning as, an immediate CC promoter having homology to, and capable of functioning as, an immediate CC early baculovirus promoter; (iii) prokaryotic promoter sequence, and (iv) CC selectable marker capable of conferring resistance to a bleomycin/ CC phleomycin-type antibiotic under transcriptional control of (ii) and CC (iii), in insect and prokaryotic cells respectively. The vectors can be used to stably transform (especially insect) cells with heterologous DNA, CC useful to allow study of gene expression and direct expression of CC heterologous gene products e.g. commercially important proteins. They are comparatives in insect cells on transport peptide hormones or biologically active derivatives in insect cells. They enable transformation of insect cell cost-translational modification of particular proteins. Shuttle vectors CC used to optimise heterologous procein expression and facilitate selection of desired transformants. (Updated on 17-OCT-2003 to standardise OS cf. 12.10)

                                                                                                                                                                                                                        The invention comprises a nucleic acid molecule consisting of all or a portion of one or more viral/baculoviral genomes and further containing at least two recombination sites that do not substantially recombine with each other. One or more of the recombination sites is capable of undergoing recombination with a compatible recombination the integration of one or more proteins active in lambda recombination. The nucleic acid of the invention replicates in prokaryotic and eukaryotic cells. The nucleic acid of the invention is useful for constructing a recombinant virus, generating replication-defective particles, preventing/inhibiting the expression of one or more genes in an organism, and are useful as gene therapy vectors. The nucleic acid of the invention is also useful for producing and expressing fusion polypeptides. The present DNA sequence represents the OpIE2 promoter that was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel nucleic acid molecule comprising all or a portion of one or moviral genome and further comprising two or more recombination sites do not substantially recombine with each other, useful as gene there
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             18-JUL-2002; 2002US-0396335P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises a nucleic acid molecule consisting of all or a portion of one or more viral/baculoviral genomes and further containing at least two recombination sites that do not substantially recombine with each other. One or more of the recombination sites is capable of undergoing recombination with a compatible recombination site in the presence of one or more proteins active in lambda recombination. The nucleic acid of the invention replicates in prokaryotic and eukaryotic cells. The nucleic acid of the invention is useful for constructing a recombinant virus, generating replication-defective particles, and are useful as gene therapy vectors. The nucleic acid of the invention is also useful for producing and expression of one or more genes in an organism, and are useful as gene therapy vectors. The nucleic acid of the invention is also useful for producing and expressing fusion polypeptides. The exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel

AAT13636-731 show open reading frames 13, 20, 22-30, 32, 38, 41-46, 50-60, 62-63, 66, 68-79, 81-87, 91-92, 96-98, 101-103, 106-127, 129-130, 140-146, 146, 146-150, 152 and 154 from a total of 154 ORFs identified in the Autographa californica nuclear polyhedrosis virus (AcNPV) clone 6. Each gene is numbered according to its position in the virus genome beginning at the left end of the linear map, and irrespective of its orientation. The direction of transcription is relative to that of the polyhedrin gene. Of the 154 ORFs identified it was found that some of the ORFs 27, 30, 32, 71, 86, 123, 126 and 127) are dispensable for virus replication in cell culture or insect larvae. These genes can be deleted from the genome to: (a) provide additional sites for inserting single or multiple copies of foreign genes; and (b) to reduce the size of the virus complementary strand relative to the polyhedrin gene. The present

                    The complete nucleotide sequence of the genome of clone 6 of the baculovirus Autographa californica nuclear polyhedrosis virus (AcNPV) has been determined. The sequence is taken from the Genbank record L22658. The patent specification claims a polynucleotide selected from open reading frames (ORFs 13, 20, 22-26, 28-30, 32, 38, 41-46, 50-60, 62-63, 66, 68-79, 81-87, 91-92, 96-98, 101-103, 106-126, 129-130, 140-146, 148-150, 152 and 154 from a total of 154 ORFs identified by the patentees. See T13636-731. Expression vectors conts. the complete genomic sequence of AcNPV, with the exception that at least one non-essential ORF is disrupted or replaced are useful for the synthesis of heterologous proteins. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequence
